LAB-4

NAME: Harsh Lad

ID: 202201493

GROUP NO: 6

SECTION: B

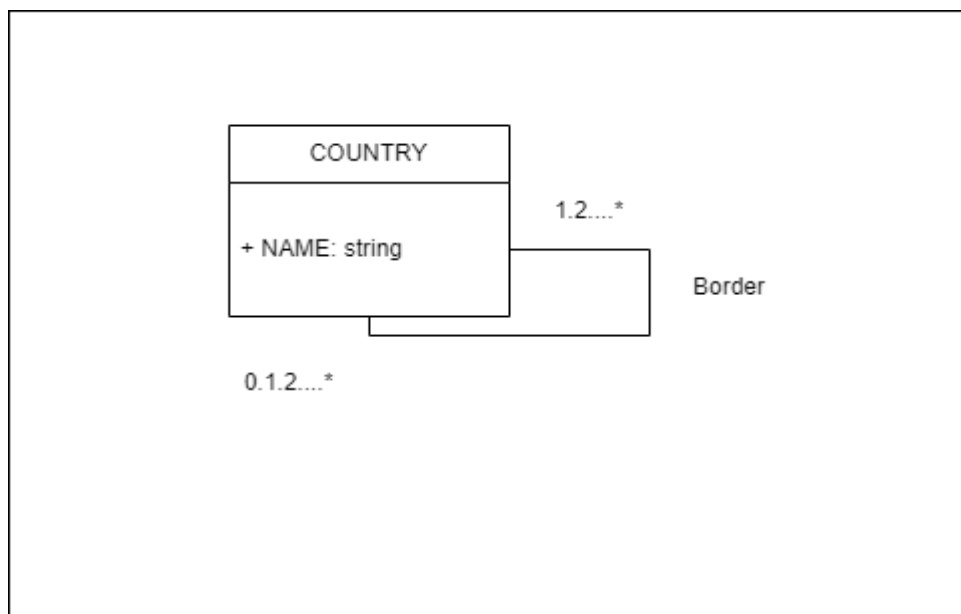

❖ Lab Report:

Q1 Prepare a class diagram for the following object diagram that shows a portion of Europe.

Figure-1

Solution:

Q.2 Prepare a class diagram for object diagram given in Figure -2. Explain your multiplicity decisions. What is the smallest number of points required to construct a polygon? Does it make a difference whether or not point may be shared between polygons? Your answer should address the fact that points are ordered.

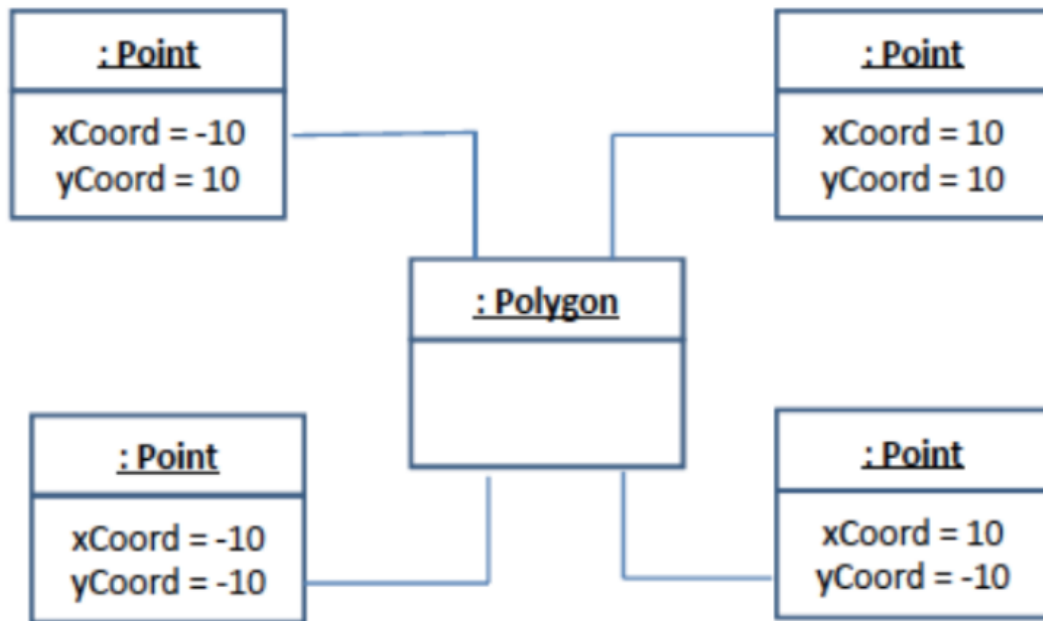

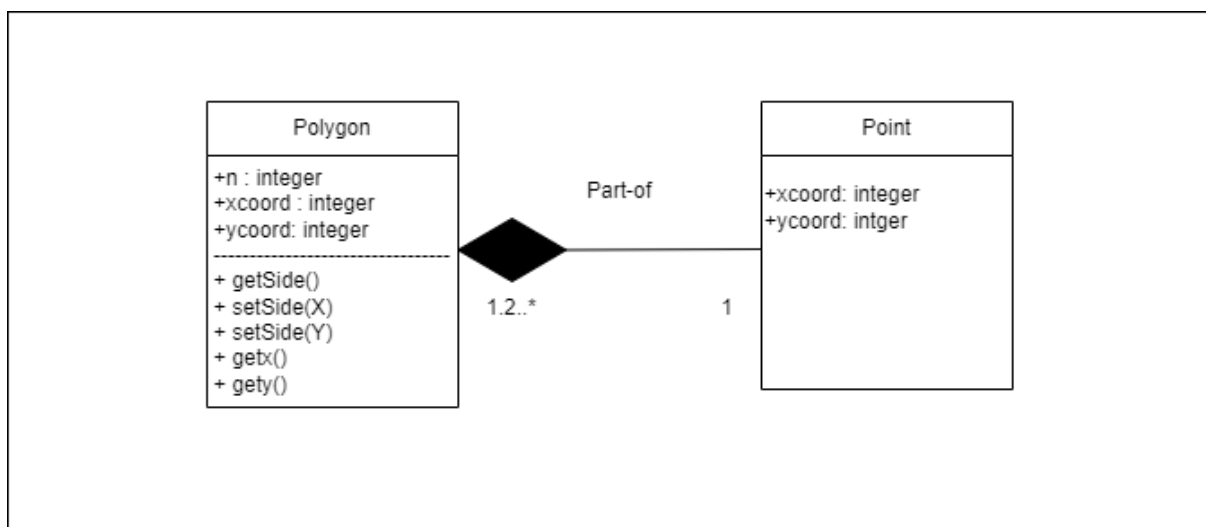

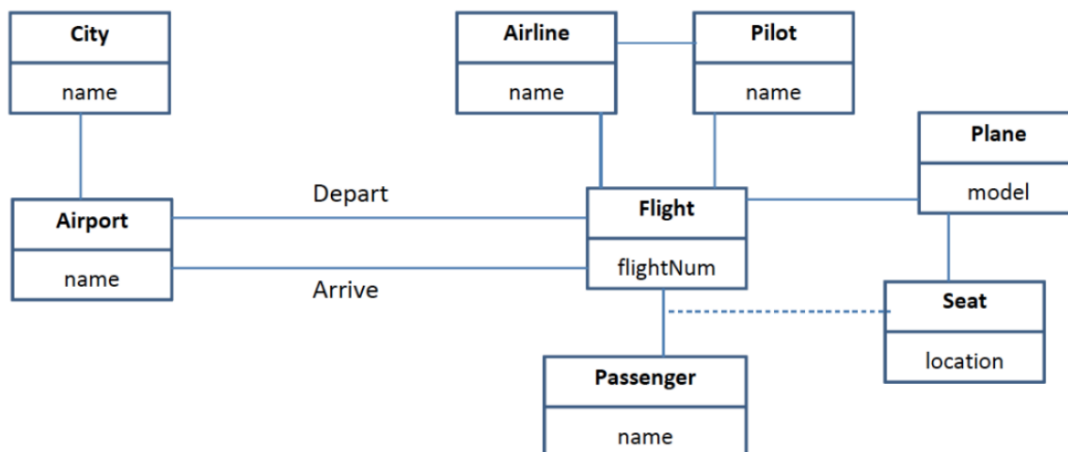

Figure - 2

Solution:

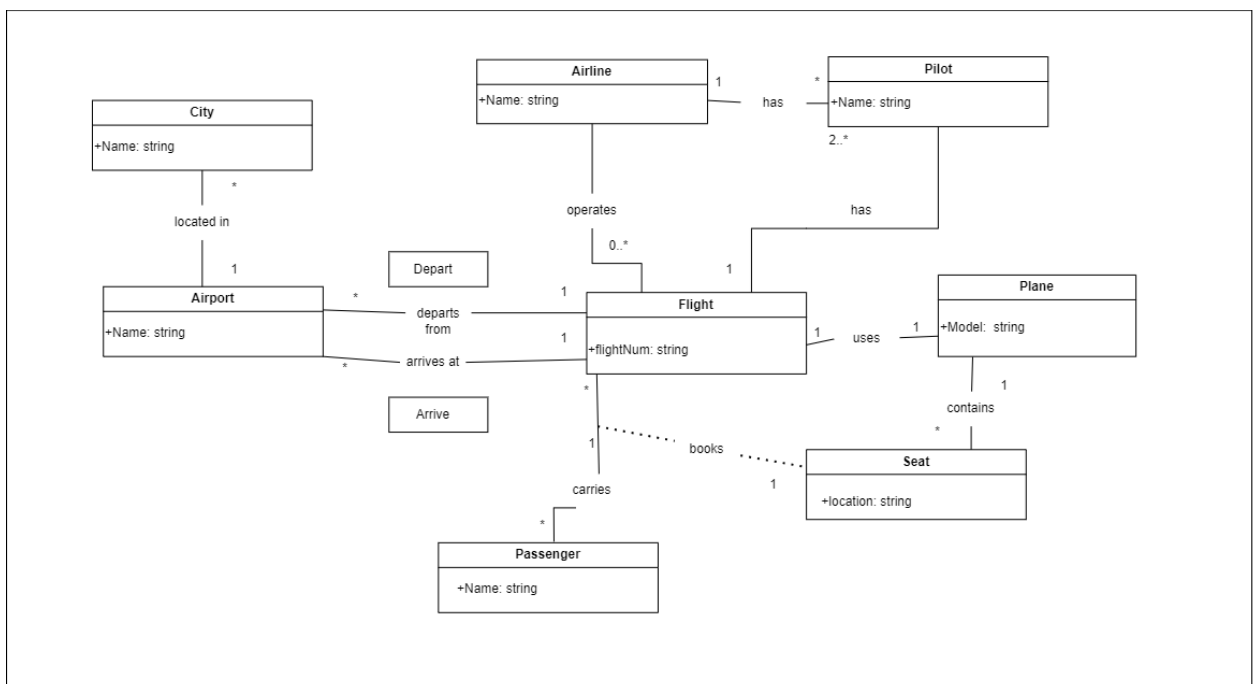

- To Construct the Polygon, at least three points are required. (i.e., Triangle)
- Points may be shared between polygons. In geometric configurations, we can have the shared points.
- Points in polygons are typically ordered. This order is essential to define boundaries of the polygon.
- Here one polygon require at least three points and points must belong to one polygon.

Q.3 Figure 3 is a partially completed class diagram of an air transportation system. Add multiplicities in the diagram. Also add association names to unlevelled associations.

Solution:

Q.4 We want to model a system for management of flights and pilots. An airline operates flights. Each airline has an ID. Each flight has an ID a departure airport and an arrival airport: an airport as a unique identifier. Each flight has a pilot and a co-pilot, and it uses an aircraft of a certain type; a flight has also a departure time and an arrival time. An airline owns a set of

aircrafts of different types. An aircraft can be in a working state or it can be under repair. In a particular moment an aircraft can be landed or airborne. A company has a set of pilots: each pilot has an experience level: 1 is minimum, 3 is maximum. A type of aero plane may need a particular number of pilots, with a different role (e.g.: captain, co-pilot, navigator): there must be at least one captain and one co-pilot, and a captain must have a level 3.

Solution:
